

We claim:

1. A detector array for use in a laser imaging apparatus, comprising:

5 a) a plurality of housings disposed in an arc around an opening in which an object to be scanned is disposed, each housing including an open front end directed to the object, a rear end and a longitudinal axis;

10 b) a detector disposed within each housing at a distance from said front end, thereby to restrict the field of view of each detector;

c) said housings being adapted to be orbited around the object about an orbit axis; and

15 d) each of said detectors being adapted to simultaneously detect light exiting from the object within the respective field of view of each detector.

2. A detector array as in Claim 1, wherein:

a) each housing longitudinal axis is disposed toward said orbit center.

20 3. A detector array as in Claim 1, wherein:

a) each housing is tubular.

4. A detector array as in Claim 1, wherein:

a) each housing is round in cross-section.

5. A detector array as in Claim 1, wherein:

25 a) each housing is square in cross-section.

6. A detector array as in Claim 1, and further comprising:

a) a lens disposed at each front end of said housings for restricting the field of view of each detector

30 7. A detector array as in Claim 6, wherein:

a) said lens is plano-convex.

8. A detector array as in Claim 1, wherein:

a) said housings are disposed in a one-dimensional array.

5 9. A detector array as in Claim 1, wherein:

a) said housings are disposed in a two-dimensional array.

10. A detector array as in Claim 1, wherein:

10 a) at least two housings are directed toward the object being scanned such that their field of views merge together.

11. A detector array as in Claim 1, and further comprising:

15 a) a sample and hold integrator connected to each detector.

12. A detector array for use in a laser imaging apparatus, comprising:

20 a) a plurality of paraboloidal mirrors disposed in an arc around an opening in which an object to be scanned is disposed;

b) a detector disposed at a distance from the focal point of each mirror, thereby to restrict the field of view of each detector;

25 c) said mirrors being adapted to be orbited around the object about an orbit axis;

d) each mirror including a focal point directed toward said orbit center; and

30 e) each of said detectors being adapted to simultaneously detect light exiting from the object within the respective field of view of each detector.

13. A detector assembly for use in a laser imaging apparatus, comprising:

- a) a housing having front and rear ends; and
- b) a photo-detector disposed within said housing at a distance from said front end, thereby to restrict the field of view of said detector.

14. A detector as in Claim 13, wherein:

- a) a lens disposed in said front end to restrict the field of view of said detector.

10

¹
~~15.~~ A method for collecting light exiting from ^{an} ~~a~~ object being scanned with a light source, comprising:

- a) providing a source of ^a laser beam;
- b) directing the laser beam toward the object being scanned;
- c) orbiting the laser beam around the object;
- d) providing a plurality of ^{detectors} ~~sensors~~ adapted to simultaneously detect the laser beam after passing through the object; and

15

20

e) restricting the field of view of each detector so that each detector only sees its own patch of surface of the scanned object, each patch not overlapping with ^{an} ~~a~~ adjacent patch.
